

Homework

Create a simple react website with 3 routes.

On your first route (homepage) have a search functionality where you can search any item from domain you choose (cars, characters in a show, movies, books etc.). It all depends on what API you implement (could be a cars API for example).

On your second route you display details of the search result. If nothing was found then redirect to a 404 route otherwise display the results.

The difficult lies in figuring out how to tie the searching to the display of the results.

Good luck !
